Web Application
Vulnerability Assessment

Process Steps

1. Initial meeting to discuss if this service is right for you
2. Further meeting to scope specific detail
3. Quotation based on your specific requirements
4. Testing of your identified service
5. Detailed report including an executive summary as well as technical and non-technical findings
6. An in-person or virtual debrief so you can understand exactly what we found and any risks to your business

What is a Web Application Vulnerability Assessment (WAVA)?

A WAVA involves looking at your website or web services to determine if there are any weaknesses which could be exploited by cyber criminals.

To do this, we use a combination of automated scans and manual passive testing which would not impact on the performance of your web services.

If any weaknesses are found, we rate the risk that they pose to your business and can advise you on next steps you can take with your internal IT team or an external partner to address them.

Who should have a WAVA?

Cyber criminals commonly run scans to look for known weaknesses in business' websites or web services. A WAVA is therefore something all businesses with any online presence should consider.

What are the benefits to my business?

- Reduces the chance that a criminal can breach your website and cause financial or operational disruption, protecting against loss of data, money and time;
- Provides you with reassurance that you are doing all you can to protect your customers, your supply chain and your employees.

How much does it cost?

Each service we offer is tailored to suit the needs of the business we are working with.
